

Easy Implementation

The LodgeNetRX™ Interactive Patient Television System is extremely easy to deploy. It utilizes your existing coaxial cable infrastructure, so a stand-alone network is not required and your IT staff can focus on other important initiatives. The system also provides a large bandwidth network that is designed for distributing large amounts of video and other entertainment services.

IMPLEMENT AND MAINTAIN WITH MINIMAL IT SUPPORT

The LodgeNetRX system is headend based and can often be used with a facility's existing televisions – which not only eliminates the expense, logistical headaches and aesthetic issues associated with set-top boxes, but leverages the investments you have already made in infrastructure and clinical solutions.

This architecture also enables interactive services and entertainment to flow to a large number of patient rooms without requiring regular access to those rooms. All of the LodgeNetRX hardware is centralized outside the patient room in a server area, minimizing not only your security exposure but disruption to patients and care staff should a service visit be necessary.

The LodgeNetRX system's interactive sessions are controlled by the patient using LodgeNet's patented *b-LAN*® (broadband local-area network) two-way digital communication system, which links patient input/output devices to resources centralized at the system headend. This minimizes expense and staff impacts while supporting multiple, simultaneous users throughout the facility. The LodgeNetRX system can also be scaled to meet a facility's needs as it grows.

LodgeNetRX Offers the Following Benefits to Keep the Pressure Off Your IT Staff:

- Allows authorized staff (including trained nurses) to easily and immediately update content on the internal information channels. This empowers your facility to put important healthcare facility information in every patient room when you need it, and saves time and money because outside resources do not have to be brought in for simple system changes.
- When you implement a LodgeNetRX solution, a team of experts from engineering to multimedia and project management to training are mobilized to design your custom system, including the menu options, content choices and functionality.
- Your staff will receive extensive, “hands-on” training in LodgeNetRX system diagnostics and patient room terminal change-outs. We also train those delegated to edit the interactive system information and educate nursing staff on how the system works and how to answer common potential questions from patients. A full system manual in printed and CD form is provided. Additionally, staff can access training documents online, as well as interactive tools to further support training and system configuration.
